

Municipalities within EnviroAtlas Boundaries

How are EnviroAtlas boundaries created?

EnviroAtlas community boundaries are derived from the 2010 US Census Bureau's Urbanized Areas (UAs). The UAs are created using Census Blocks that "comprise a densely settled core of ... blocks that meet minimum population density requirements, along with adjacent territory containing non-residential urban land uses as well as territory with low population density included to link outlying densely settled territory with the densely settled core." UAs must have at least 50,000 people. Because the EnviroAtlas community component uses the Census Block Group (each comprised of 4-10 Census Blocks) as a unit of analysis, community boundaries were created from the UAs rather than reflecting the UAs themselves.

Block groups were initially included if 50% of their population was within the UA boundary. From there, all holes were filled and all islands were excluded. If a block group only touched the main body of block groups at one corner, it was excluded.

The EnviroAtlas team then assessed each community boundary individually to ensure that it included all the area relevant to the principal community of focus and did not extend far beyond that community. Where available, the municipal boundaries were compared to the EnviroAtlas boundaries to ensure that the municipal core of the principal community was fully included.

Because EnviroAtlas boundaries are based on Census Urbanized Areas rather than municipal boundaries, they often contain many municipalities near the target city.

How do I use this document?

Page 2 of this document contains a table of contents listing each EnviroAtlas target community. Each community name is a link to that community's page within this document. The additional municipalities within that community are listed on the community's page along with an approximation of how much of each municipality is included.

In general, an "All" designation means that the entire municipality is within the EnviroAtlas boundary. "Most" means that approximately 50 to 99 percent of the municipality is within the EnviroAtlas boundary. "Part" means that approximately 0 to 50 percent of the municipality is within the EnviroAtlas boundary.

Please note that these lists were created using the NavTEQ 2011 municipalities data layer. Because the data are not directly from the municipalities, the resulting municipal boundaries may not exactly reflect the actual municipal boundary. Any changes to the municipal boundary since 2011 are not included in this list.

In the figure to the left, Durham (yellow) and Chapel Hill (pink) are both given the "All" designation because they are completely within the EnviroAtlas boundary while Hillsborough (orange) and Carrboro (green) are both given "Most" because they go slightly beyond the EnviroAtlas boundary.
